NEBIUS x NVIDIA GLOBAL AI HACKATHON · BEST APPS AND AGENTS

Finding with Nemo

An agent that finds nearby businesses, researches them on the live web, proves every claim with a source quote, and plans your route.

NVIDIA Nemotron 3 on Nebius Token Factory · Tavily live web · Open source (Apache 2.0)

When I went out to find customers, nothing told me what was around me

No starting point

Sales tools assume you already know who to call. Real prospecting starts earlier: which businesses are nearby, and who is worth a visit?

Knowledge walks away

The note from the last visit, the web research, what changed this week. It lives in one person's head or phone.

AI you cannot check

Most assistants state things with no way to verify them. A wrong claim to a customer costs trust.

So we built one tool: instant research, and an agent that acts, in the field and in your own space.

What it does

1. Pick an area, ask in plain words

The agent sees your screen and searches Google Maps for your own tags inside it.

2. Approve, never surprised

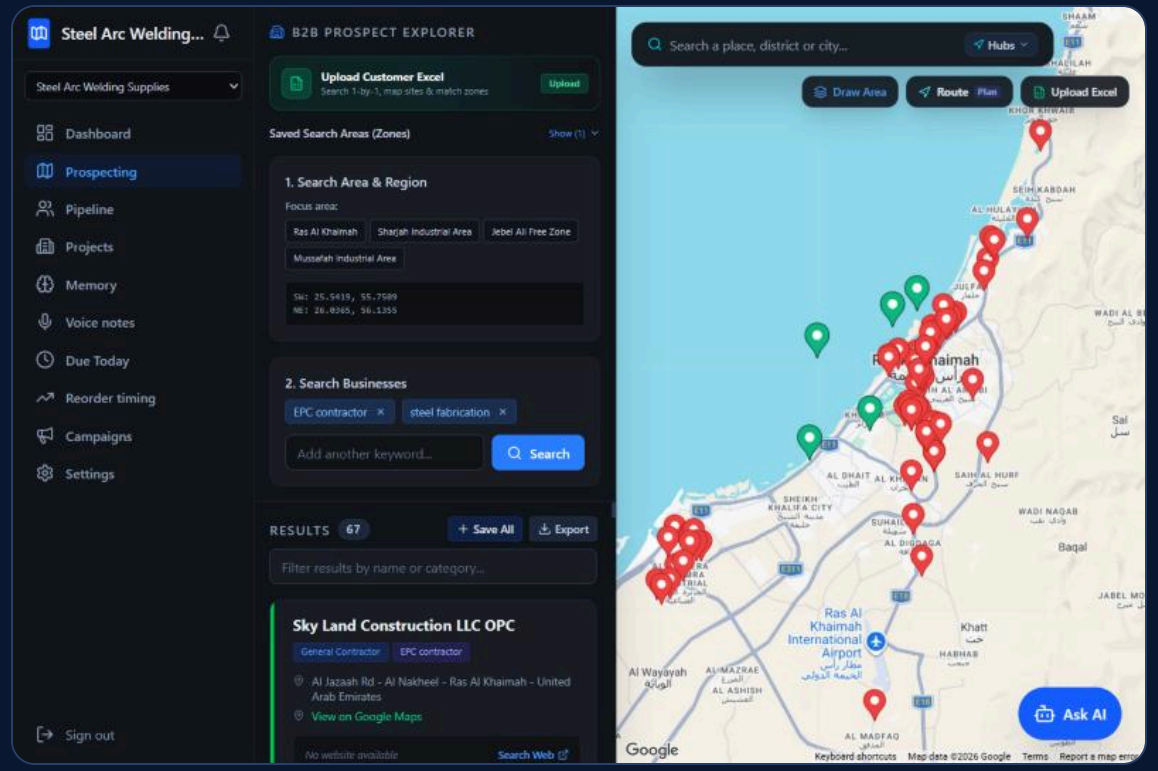

Anything that changes your data is a proposal you approve. New tags are remembered.

3. Cited research on demand

Tavily brings the live web. Each finding keeps a quote that code checks on the page.

4. Field tools and team memory

Routes from where you are, voice notes in any language, a 3D memory of what the team knows.

Live app: 67 real EPC contractors and fabricators around Ras Al Khaimah

One engine, three users

Job seekers

Ask: "Find software and IT companies hiring in my selected area."

Employers around you, and what each does. No ten browser tabs.

Sales teams LIVE DEMO

Ask: "Find welding fabrication companies and EPC contractors in my selected area."

A prospect list you can trust, with sources and a route for the day.

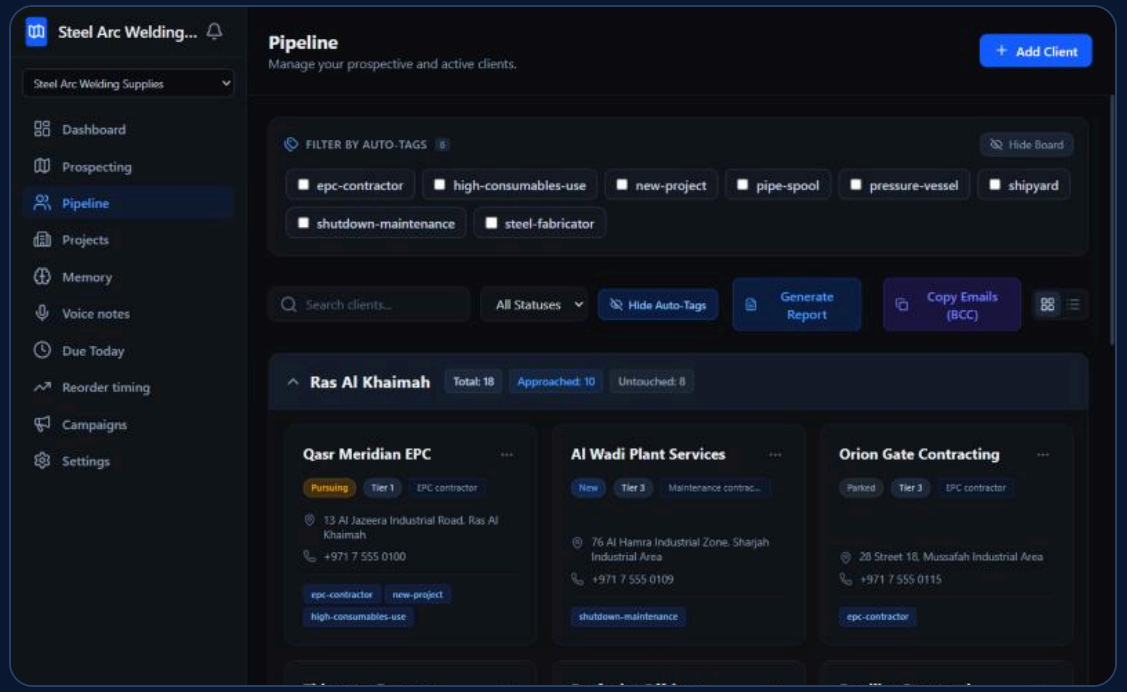

Procurement

Ask: "Find steel plate and welding consumables suppliers in my selected area."

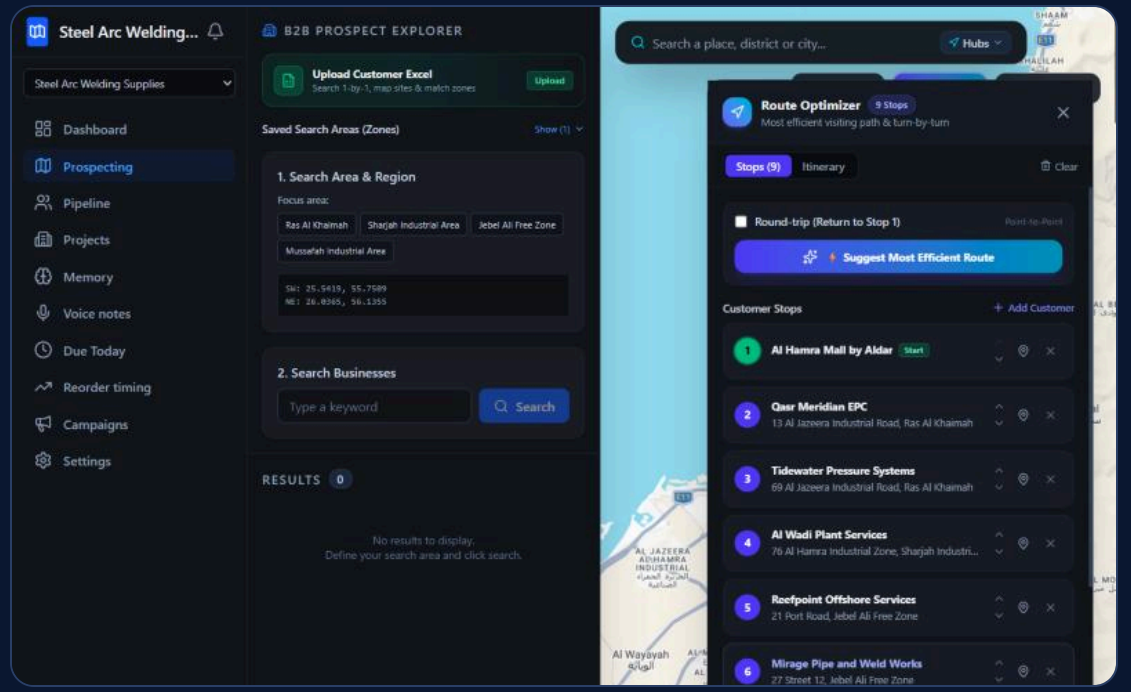

A supplier shortlist in minutes, on the map.

Built for any trade and any city: a cafe supplier, a solar installer, a dental supplier and a welding supplier all run on the same code.

Demo: welding supplies for fabricators and EPC contractors

Saved pipeline: tagged, tiered, with status

Route that starts where you are

Find → Approve and save → Research with citations → Route → Voice note → Memory

Trust is built in: no claim without a source

Evidence Gate

A finding counts as verified only if its quote appears word for word on the source page. Unproven claims are dropped.

Reply verifier

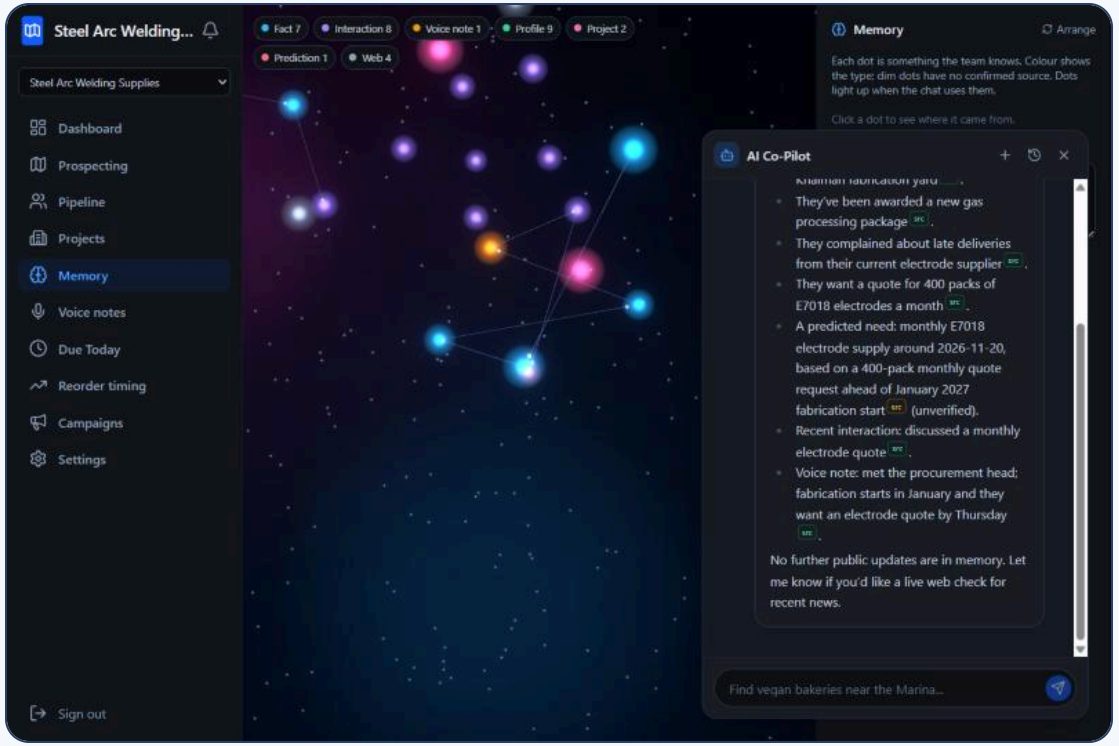

A second model pass marks any sentence in an answer with no supporting source as "not verified".

13/13

prompt-injection attacks flagged, none reached the user

30/30

agent regression questions passed across 3 businesses*

Answer with source badges; memory dots lit behind it

*A regression score: those questions were also used to find and fix bugs. Per-organisation row-level security. Hard per-user AI request limit.

Nemotron on Nebius Token Factory: one job each

Model	Does	Features
Ultra 550B-A55B	Careful reasoning, fact extraction	Onboarding profile, quote-checked facts from pages and voice notes, fact-checking, project finding
Super 3.5 Super-VL	The agent and the writing	Tool-calling chat agent, cited research briefs, insights, voice-note translation
Nano 3.5 Lightning	Fast, frequent checks	Tag suggestions, route stop picking, auto-tagging, reply verifier
Qwen3-Embedding 8B	Memory search	Every stored fact is embedded; questions find the closest; 3D memory view
Tavily live web	Search and page reading	Onboarding research, cited client research, agent news, fact-checking

One OpenAI-compatible API on Nebius Token Factory serves all four models. Maps (Google) and Supabase are not models.

How it is built

Browser

React, Vite, Tailwind. Google Maps, 3D memory view (three.js).

→

App server

Express, Docker image built by GitHub Actions, hosted on Render. Runs every request **as the signed-in user**.

→

Nebius Token Factory

Nemotron Ultra, Super, Nano and embeddings

Tavily

Live web search and extract

Supabase

Postgres, pgvector, auth, row-level security

Every write is an approval card. Web text is fenced as untrusted, and write tools are blocked after a flagged result.

What we learned, and what is next

Honest limits

- Speech recognition uses the browser; Token Factory has no audio endpoint.
- Embeddings are Qwen: no Nemotron embedding model was available.
- Multi-step agent answers take 20 to 60 seconds.
- Malayalam and Urdu translation were unreliable; Arabic and Hindi were fine.

Next

- Nemotron speech recognition for voice notes.
- A Nemotron safety model for screening web text.
- Scheduled watchers as Nebius Jobs.
- Team assignment of leads.

Lesson: evidence beats confidence. A model sentence only counts when code can find its quote on the page.

Try it
